Chapter 16 Evolution of Populations 16-1 Genes and Variation Darwin's original ideas can now be understood in genetic terms. Beginning with variation, we now know that traits are controlled by genes and that many genes have at least two forms, or alleles. We also know that individuals of all species are heterozygous for many genes.

Section 16-1: Genes and Variation Biologists have discovered that there are two main sources of genetic variation: mutations and the genetic shuffling that results from sexual reproduction. The number of phenotypes produced for a given trait depends on how many genes control the trait.

Gene expression is the process by which the genetic code - the nucleotide sequence - of a gene is used to direct protein synthesis and produce the structures of the cell. Genes that code for amino acid sequences are known as 'structural genes'. Gene control regions: A promoter. A region a few hundred nucleotides 'upstream' of the gene (toward the 5' end).
